

AMENDMENTS TO THE ABSTRACT

Please replace the Abstract with the following amended Abstract:

~~--- In order to resolve the problem, an~~ An image forming apparatus of the invention is constructed by a constitution including exposing means including an includes an exposer exposure head comprising including an organic electroluminescence element including at least an anode for injecting a hole, a luminescent layer having a luminescent region and a cathode for injecting an electron on a board. ~~[[.]] [[a]]~~ A photosensitive member is formed with an electrostatic latent image by exposing light of the exposer ~~exposing means~~, ~~developing means~~ a developer ~~for forming~~ forms a toner image on the photosensitive member by supplying a toner to the electrostatic latent image, and ~~cooling means~~ a cooler cools ~~for cooling~~ the organic electroluminescence element. ~~The organic electroluminescence element is cooled by the cooling means in this way and therefore,~~ such that the temperature of the organic electroluminescence element can be controlled. ---
